

What is a microgrid cost model?

The National Renewable Energy Laboratory was commissioned by the U.S. Department of Energy to complete a microgrid cost study and develop a microgrid cost model. The goal of this study is to elucidate the variables that have the highest impact on costs as well as potential areas for cost reduction. This study consists of two phases.

Why do microgrids cost so much?

Location and size of the microgrid also play a role, Adams says. Cost can add up for a microgrid if it's located in a place where construction isn't easy, like a dense urban environment, especially if a lot of distribution reconfiguring is necessary. Scale influences price - although not always as one might think.

How much does energy storage cost a microgrid?

In commercial and industrial microgrids, energy storage represents 15% and 25% of the total costs per megawatt, respectively. In commercial microgrids, soft costs account for 43%, while in community microgrids they account for 24%.

How much does a microgrid controller cost?

Controller costs per megawatt range from \$3,500/MW to nearly \$600,000/MW (excluding outliers), with a mean of \$85,000/MW. The analysis shows that controller costs as a percentage of total microgrid costs are relatively similar among the projects in our database and the NY Prize data despite the wide variety of system sizes, types, and uses.

How much does a microgrid cost per megawatt?

The community microgrid market has a mean cost of \$2.1 million per megawatt of DERs installed.

What is the DOE's microgrid cost study?

The U.S. Department of Energy's (DOE's) microgrid cost study is identifying the costs of components, integration, and installation of U.S. microgrids; project cost improvements; and technical accelerators during the next 5 years and beyond.
