

## What is advanced rail energy storage?

Advanced Rail Energy Storage (ARES) uses proven rail technology to harness the power of gravity, providing a utility-scale storage solution at a cost that beats batteries. ARES' highly efficient electric motors drive mass cars uphill, converting electric power to mechanical potential energy.

## How does Ares energy storage work?

ARES energy storage technology employs a fleet of electric traction drive shuttle-trains, operating on a closed low-friction automated steel rail network to transport a field of heavy masses between two storage yards at different elevations.

## How long do ARES Systems last?

ARES systems are machines and have a 40-years-service life with no degradation and no thermal runaway. ARES uses recycled steel rails, low-carbon and reclaimable mass cars, sophisticated motors and electronics, and freely available gravity, providing a fully sustainable renewable energy storage solution for utility-scale deployment.

## What rated power and energy capacity can an Ares facility provide?

An ARES facility can be constructed over a wide range of rated power and energy capacities from a small 25 MW facility with 6.25 MW h of storage capacity up to or beyond a 2000 MW facility with 240 000 MW h of storage.

## How do Ares shuttle trains work?

During periods where excess energy is available on the grid (Reg-Down), ARES shuttle trains draw electricity from the grid which powers their drive motors to move the trains uphill against the force of gravity--efficiently converting electrical energy into gravitational potential energy.

## How do ARES Systems work?

In an ARES system the rate of energy input and output may be varied by controlling the speed and quantity of masses in motion (increasing or decreasing the intervals between shuttle units), allowing rapid response to grid power requirements over a wide range of output at a constant efficiency.

What is ARES (Advanced Rail Energy Storage) ARES is a large-scale energy storage device that uses a gravitational train system. This innovation consists of several sets of train on the funicular railroad. This system sits on a hill slope so it can utilize gravitational force to discharge the potential energy. Its cars are solid concrete ...

The Bureau of Land Management approved the Advanced Rail Energy Storage Project (ARES) in this location. It will extend far up onto this bajada. The proposed project is a 50 megawatt gravity based energy storage system that would be constructed on 72 acres (but will disturb over 150 acres for roads and transmission) of BLM managed public land.

Advanced Rail Energy Storage (ARES) has developed a breakthrough gravity-based technology that will permit the global electric grid to move effectively, reliably, and cleanly assimilate renewable energy and provide significant stability to the grid. ARES stores energy by raising the elevation of mass against the force of gravity, and recovers ...
