

Brief introduction of Jinshang Wind Power Plant

What is a yaw system in a wind turbine?

This so-called yaw system enables the nacelle to be positioned based on the direction of the wind. The rotor starts working only when the wind speed is greater than 10 km/h, while the wind turbine shuts down at speeds of over 90 km/h, for safety reasons. Basically, the wind's kinetic energy is converted into mechanical energy by the rotor.

What are the advantages and disadvantages of a wind power plant?

The electric power generated from the wind power plant varies with variations in wind velocity. But the advantage of a wind power plant is that the operating cost of this plant is less and it is a non-polluting source of electrical energy. One single wind turbine is not sufficient to produce electrical energy in bulk amounts.

What is a student project on wind power plants?

The document summarizes information about a student project on wind power plants. It discusses the basics of how wind energy is created from uneven heating of the atmosphere by the sun. It describes the main components of horizontal and vertical axis wind turbines, including blades, shafts, gearboxes, generators, controllers, and towers.

What are the parts of a wind power plant?

This document provides an overview of wind power plants. It discusses the typical parts of a wind turbine, including the rotor, transmission system, generator, and yaw and control systems. The document also outlines the advantages of wind power in being a renewable and pollution-free source of energy.

Which is the largest wind power plant in India?

The first Wind power plant was set up in Ratnagiri, Maharashtra, Okha in Gujarat and Tuticorin in Tamil Nadu, in the year 1986. There are many Wind power plants in India but the largest wind power plant in India is in Tamil Nadu, with a 7455.2 MW capacity for the production of Wind Energy. Followed by Maharashtra with 4450.8 MW.

What are the advantages of wind energy projects?

A very short lead time for planning and construction is required as compared to conventional power projects. Wind energy projects are flexible with regard to an increasing energy demand- single turbines can easily be added to an existing park. Finally, wind energy projects can make use of local resources in terms of labour, capital and materials.
