Charge and discharge ratio of lithium battery energy storage

What is a lithium-ion battery state of charge (SOC)?

The accurate estimation of lithium-ion battery state of charge (SOC) is the key to ensuring the safe operation of energy storage power plants, which can prevent overcharging or over-discharging of batteries, thus extending the overall service life of energy storage power plants.

What is a lithium-ion battery?

The lithium-ion battery, which is used as a promising component of BESS that are intended to store and release energy, has a high energy density and a long energy cycle life .

How much energy does a lithium secondary battery store?

Lithium secondary batteries store 150-250 watt-hours per kilogram(kg) and can store 1.5-2 times more energy than Na-S batteries,two to three times more than redox flow batteries,and about five times more than lead storage batteries. Charge and discharge efficiency is a performance scale that can be used to assess battery efficiency.

How do we estimate lithium-ion batteries' state of charge and health?

Based on six open-circuit voltage models, a joint estimation of the state of charge and state of health for lithium-ion batteries was carried out using a fractional-order model and Gaussian linear model. A multi-threaded dynamic optimization method was proposed to enhance accuracy.
