

Hello, i built a NuclearCraft Reactor that is 7x7 and 12 blocks high, it produces a colossal amount of energy, and i was wondering what is the best way to Store this energy, should i use Induction Matrix (Mekanism), should i use a array of EnderIO Capacitors or is there a better way to storage this energy?

All Energy Conduits do have power buffers. You can view the network's conduit power storage from a Power Monitor (and some HUD mods, I think). Item Conduits do not have internal inventories (we aren't counting things like upgrade slots, obviously). They basically "teleport" items from the source to the correct destination.

The Basic Capacitor Bank is a block added by Ender IO. It is used to store Redstone Flux (RF); each block can store one million RF. It is a shapeless multiblock; putting a Basic Capacitor Bank next to another Basic Capacitor Bank will combine their energy storage. Within the GUI, up ...

A: Energy Bar; a Simple Stirling Generator has a capacity of 2,000 RF. B: Configure IO; Config from which side you want items to be extracted or given automatically to the Simple Stirling Generator. C: Combustion: Clicking here you'll see all the combustion items that the Simple Stirling Generator can use to make energy!

EnderIO(???)??????,?????????? ??????????????????,??"?????"??????,????????????????????? ...

Galacticraft can accept energy from EnderIO, but energy almost can't transfer the other way round, I added a screenshot with some examples. bottom-left - Power is transferring from the EnderIO generator to the Energy ...

Depending on their Global Level, Capacitors can increase the Speed, Range or Energy Storage of machines. Special capacitors with wildly varying properties can be found in loot chests. Basic Capacitor Global Level: 1. Double-Layer Capacitor Global ...

It is intended behaviour that Galacticraft cables and EnderIO power conduits cannot directly connect to each other. Use a block like Energy Storage Module or an EnderIO Capacitor if you want to join the two types of power.

The mod is centered on various kinds of teleportation and adds many different machines and items for all purposes, including ore processing, farming mobs, transport, automation, and player progression. Ender IO uses Forge Energy for its power system, naming its ...

Capacitor Banks are this mod's version of an energy storage block. However, it can also connect with other capacitor banks to form a multiblock structure. This increases its maximum throughput (max energy per tick input and output) as well as its maximum capacity.

EnderIO Energy Conduits: Pros: Can overlap with other Conduits, allowing for transfer of Items, Fluids, Redstone, ME, and OpenComputers Cable all in the same block, can also properly function with Immersive Engineering Connectors if configured right.

Galacticraft can accept energy from EnderIO, but energy almost can't transfer the other way round, I added a screenshot with some examples. bottom-left - Power is transferring from the EnderIO generator to the Energy storage module, despite it ...

It's very energy efficient. Once you can afford them build boosters and put a column of 3 on top of the digger to expand it to 16x16. Edit: Also put clay into the sag mill to get silicon. I find this ...

Both have their drawbacks, but both are energy storage. In any case, beyond the answers you've already been given, nuclearcraft's batteries and piles are also quite energy dense. I'm sure an ...
