

Besides the commitment to reduce carbon emissions, there are several other factors that favor the momentum of Spain's renewable energy industry and allow the country to offer one of the most attractive competitive combinations in Europe.

To achieve decarbonisation and energy saving objectives, many countries are encouraging individual homes and buildings to shift from fossil fuel heating systems such as gas- or oil-fired boilers to systems like heat pumps which are much more efficient and can be powered with electricity from low-carbon sources.

By incorporating renewable energy sources like solar panels, you can lower your energy costs while enhancing the attractiveness and market value of your home. If you're interested in buying a property in Spain, explore our guide to understand the process and key factors you should consider.

Renewable energy in Spain, comprising bioenergy, wind, solar, and hydro sources, accounted for 15.0% of the Total Energy Supply (TES) in 2019. Oil was the largest contributor at 42.4% of the TES, followed by gas, which made up 25.4%.

While achieving energy efficiency depends, among other factors, on the state of the homes, there are various strategies related to the implementation of renewable energies, air conditioning...

According to the documents presented today, 2023 will also be remembered as the year when all historical renewable energy generation records were shattered. For the first time ever, over half of the electric mix (50.3%) ...

Spain's total wind generation capacity, its prime renewable source in recent years, has doubled since 2008. Solar energy capacity, meanwhile, has increased by a factor of eight over the same period.

Both reports show that in 2022 Spain continued to demonstrate its leadership in renewable energy in the European Union. It is second only to Germany in terms of installed renewable power capacity and also in terms of installed wind power capacity.

Spain's total wind generation capacity, its prime renewable source in recent years, has doubled since 2008. Solar energy capacity, meanwhile, has increased by a factor of eight over the same...

According to the documents presented today, 2023 will also be remembered as the year when all historical renewable energy generation records were shattered. For the first time ever, over half of the electric mix (50.3%) originated from resources such as wind, sun, or water.

Both reports show that in 2022 Spain continued to demonstrate its leadership in renewable energy in the European Union. It is second only to Germany in terms of installed renewable power capacity and also in terms of ...
