

What is an energy storage system?

An energy storage system (ESS) for electricity generation uses electricity (or some other energy source, such as solar-thermal energy) to charge an energy storage system or device, which is discharged to supply (generate) electricity when needed at desired levels and quality. ESSs provide a variety of services to support electric power grids.

What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to provide electricity or other grid services when needed.

What is the power capacity of a battery energy storage system?

As of the end of 2022, the total nameplate power capacity of operational utility-scale battery energy storage systems (BESSs) in the United States was 8,842 MW and the total energy capacity was 11,105 MWh. Most of the BESS power capacity that was operational in 2022 was installed after 2014, and about 4,807 MW was installed in 2022 alone.

Why do we need energy storage systems?

When you turn on a hair dryer in your home, somewhere, an electricity generation plant is turning up just a tiny bit to keep the grid in balance. Energy storage systems allow electricity to be stored--and then discharged--at the most strategic times.

How does energy storage work?

The so-called battery "charges" when power is used to pump water from a lower reservoir to a higher reservoir. The energy storage system "discharges" power when water, pulled by gravity, is released back to the lower-elevation reservoir and passes through a turbine along the way.

What are the benefits of energy storage systems for electric grids?

The benefits of energy storage systems for electric grids include the capability to compensate for fluctuating energy supplies: EES systems can hold excess electricity when it's available and then contribute electricity supply at times when primary energy sources aren't contributing enough, especially during periods of peak demand.
