How far apart should PV panels be mounted?

The following are answers to the most common questions that we receive about mounting the PV panels. The mounting rails should be spaced apart as above. For example, using a 1.6m high panel, the rails should be spaced approx. 0.8m apart and the panels should be clamped so that they overhang the rails by 0.4m at the top and bottom. MAX.

What size solar mounting rails do I Need?

Solar mounting rails come in various sizes to accommodate different panel dimensions. The standard length is 4200 mm, which suits four units of 990 mm-996 mm width PV modules. However, customized lengths can range from 50 cm to 600 cm, allowing flexibility for various installation projects.

What is the difference between railed and shared rail solar panels?

This type of mounting system works the same as the railed system. The difference lies in the number of rails needed to be installed. While railed systems for two solar panels row use four rails in total, shared-rail systems use only three rails -- by using two rails on the edges and one in the middle that shares the two rows.

What size PV panels do I Need?

The standard length is 4200 mm, which suits four units of 990 mm-996 mm width PV modules. However, customized lengths can range from 50 cm to 600 cm, allowing flexibility for various installation projects. Choosing the correct size ensures that your panels are adequately supported and aligned.

Are there alternative rails for solar panels?

Several alternative rail setups exist to standard rails, such as rail-less or shared-rail. An added benefit of rails is that they provide a clear space to run the wiring of your solar panel system, helping to reduce clutter and improve the safety and aesthetics of your installation.

Solar panel mounts are used to secure your solar panel array to a surface and can also be used to optimize your panel's energy production through its angle and direction. The type of solar panel mounts that would be ...
