

How to connect photovoltaic power plants to energy storage power stations

What support devices can be used in a large scale PV power plant?

In addition, there can be other supporting devices such as FACTS, capacitor banks or storage systems to provide grid support functions. As shown, large scale PV power plants have several generation units (generation unit = PV array + converter).

Can a grid-connected solar PV power plant operate smoothly?

The smooth operation of a grid-connected solar PV power plant is dependent on the voltage and frequency of the grid staying within certain limits that are acceptable for the inverter. Grid instability may result from varying loads applied on the utility substation.

Can a large scale photovoltaic power plant interconnect energy storage?

The way to interconnect energy storage within the large scale photovoltaic power plant is an important feature that can affect the price of the overall system. This is a field still requiring further research.

How can energy storage help a large scale photovoltaic power plant?

Li-ion and flow batteries can also provide market oriented services. The best location of the storage should be considered and depends on the service. Energy storage can play an essential role in large scale photovoltaic power plants for complying with the current and future standards (grid codes) or for providing market oriented services.

Which technology should be used in a large scale photovoltaic power plant?

In addition, considering its medium cyclability requirement, the most recommended technologies would be the ones based on flow and Lithium-Ion batteries. The way to interconnect energy storage within the large scale photovoltaic power plant is an important feature that can affect the price of the overall system.

How much energy does a PV plant need?

To sum up, from PV power plants under-frequency regulation viewpoint, the energy storage should require between 1.5% to 10% of the rated power of the PV plant. In terms of energy, it is required, at least, to provide full power during 9-30 min (see Table 5).

In the review [14], the focus is put on the intermittence issue of roof-top PV power plants and the use of energy storage systems for avoiding reverse power flows. In [21], ...
