

How to ground an energy storage container

How do you ground a shipping container?

Grounding a shipping container is a quick and simple process. Obviously, you'll first need to purchase a grounding kit. They can be found on Amazon (Field Guardian Complete Grounding Kit, 3-Feet), or at just about any farm or ranch supply store (we grabbed them at JAX Mercantile in Fort Collins, CO).

Does a container need a grounding system?

A properly grounded structure will not have any build-up of electrical charge that could occur through any current leak or static electricity build up. If the container is sitting directly on the ground no grounding system is needed, as any electrical charge will pass straight through the container into the ground.

Why do you need to ground a container?

In a very basic sense, the container can act as a Faraday cage and protect everything inside from electrocution. If the container structure is put some type of elevated foundation there may be a need to ground the container to allow any charge to pass through the unit into the earth.

Should you ground a shipping container to prevent electrocution?

Grounding a shipping container to prevent electrocution or damage to the items inside is a question that regularly comes up, and one that needs to be addressed properly.

Can pre-engineered and self-contained energy storage systems have working space?

Language found in the last paragraph at 706.10 (C) advises that pre-engineered and self-contained energy storage systems are permitted to have working space between components within the system in accordance with the manufacturer's recommendations and listing of the system.
