

Does Kyrgyzstan have solar energy?

Kyrgyzstan's geographic location and climatic conditions are quite favourable for the broader development of solar energy, evident in solar radiation maps.

Could Kyrgyzstan attract massive energy and transport investments?

Given the right socio-political and policy conditions, the country could attract massive cross regional energy and transport investments (World Bank, 2019). Kyrgyzstan's gross domestic product (GDP) per capita in 2020 was USD 1 176 (World Bank, 2021).

How can Kyrgyzstan achieve a long-term energy strategy?

Formulate an energy research, development and innovation (RDI) strategy, including the setting of clear priorities within thematic areas and applied research, to ensure that priorities are linked with those of the new country's long-term energy strategy to 2050. Kyrgyzstan 2022 - Analysis and key findings.

Can underground gas storage be used for hydrogen storage?

The use of underground gas storage for hydrogen storage is also included in the Long-Term Strategy 2050 - Austria according to Regulation (EU) 2018/1999 of the European Parliament and of the Council on the Governance System for the Energy Union and Climate Change.

How big is Kyrgyzstan?

The area of the country is 199 951 square kilometres (km²); the population is 6.71 million, 1.05 million of which live in the capital, Bishkek. Mountains occupy 94% of the territory of Kyrgyzstan.

Why does Kyrgyzstan lack technology research and development?

Technology research and development is almost non-existent in Kyrgyzstan: the main reasons for this are a lack of funding (state funding of research institutes under the National Academy of Science is insufficient) and the country's small market. The most recent research by the National Academy of Science includes:

Underground Sun Storage 2030 is a flagship project that is researching a solution for large-scale seasonal storage of renewable energy. The renewable energy generated will be stored in the form of pure hydrogen (H₂) ...

In simple terms, Underground Sun Storage 2030 is about using electrolysis to convert solar energy into pure hydrogen in a climate-neutral way during the summer months and then storing it in depleted natural gas reservoirs during ...

If dihydrogen (H₂) becomes a major part of the energy mix, massive storage in underground gas storage (UGS), such as in deep aquifers, will be needed. The development of H₂ requires a growing share ...

In the lead project "Underground Sun Storage 2030" (USS 2030), the safe, seasonal and large-scale storage of renewable energy in the form of hydrogen in underground gas reservoirs is being developed.

In simple terms, Underground Sun Storage 2030 is about using electrolysis to convert solar energy into pure hydrogen in a climate-neutral way during the summer months and then storing it in depleted natural gas reservoirs during the winter months.

Underground Sun Storage: Final Report Public 13 - January 2020 Seite 8 von 172 geochemical dynamic simulation models, to rebuild and verify the results from the lab. Once this was done, ...

Underground Sun Storage 2030 is a flagship project that is researching a solution for large-scale seasonal storage of renewable energy. The renewable energy generated will be stored in the form of pure hydrogen (H₂) in depleted natural gas reservoirs.

Underground Sun Storage: Final Report Public 13 - January 2020 Seite 8 von 172 geochemical dynamic simulation models, to rebuild and verify the results from the lab. Once this was done, the models were used to make predictions on long-term influences of hydrogen in the subsurface.

The Kyrgyz Republic has a fairly large renewable energy potential, including the energy of the sun, small watercourses, biofuels, geothermal and wind energy. However, despite the huge potential, the practical use of renewable energy ...

The Kyrgyz Republic has a fairly large renewable energy potential, including the energy of the sun, small watercourses, biofuels, geothermal and wind energy. However, despite the huge potential, the practical use of renewable energy sources (RES) is currently insignificant, and in the country's energy balance it is no more than 1%.

The project was financed by RAG Austria AG and funded by the Austrian Climate and Energy Fund. It could be found that the storage of hydrogen in RAG's reservoirs is possible and furthermore that even generation of renewable methane in the subsurface might be feasible on an industrial scale.
