

Lithium batteries are not suitable for long-term energy storage

Are lithium-ion batteries the future of energy storage?

Lithium-ion batteries are currently best positioned to meet the demand for energy storage over the next five to 10 years. However, other battery storage technologies will be needed for long-term energy storage and larger-scale applications in the long run.

Is lithium ion a good choice for energy storage?

According to Robinson, Lithium-ion is not the best choice for long-term energy storage. You can optimize different Lithium-ion cells for power and energy, but you cannot extend this to tens of hours or even days.

Are lithium-ion batteries a good storage technology?

Lithium-ion batteries are the one storage technology that has made progress in the last decade (see Building better batteries). 'There's been massive investment going into this technology simply because [of] electric vehicles,' says Schmidt.

Can lithium-ion batteries solve all problems?

Lithium-ion batteries can't solve all problems and are not appropriate for large-scale and long-duration applications, according to Robinson. For instance, a large solar project in China capable of powering 2,000 homes would need massive-scale storage, in the gigawatt-hour range, a task not suitable for Lithium-ion batteries.

Are lithium-ion batteries bad for the environment?

(Lead-acid batteries, by comparison, cost about the same per kilowatt-hour, but their lifespan is much shorter, making them less cost-effective per unit of energy delivered.)² Lithium mining can also have impacts for the environment and mining communities. And recycling lithium-ion batteries is complex, and in some cases creates hazardous waste.³

Can lithium-ion battery storage stabilize wind/solar & nuclear?

In sum, the actionable solution appears to be ~8 h of LIB storage stabilizing wind/solar + nuclear with heat storage, with the legacy fossil fuel systems as backup power (Figure 1). Schematic of sustainable energy production with 8 h of lithium-ion battery (LIB) storage. LiFePO₄/graphite (LFP) cells have an energy density of 160 Wh/kg (cell).
