

This section includes relevant information on the electrical power system comprised by generation, transmission, distribution, sales, retail, and consumption. Overview. Mexico's National Power System (Sistema Eléctrico Nacional or SEN) is one of the largest in the Western Hemisphere.

An Independent System Operator (ISO) was created called Centro Nacional de Control de Energía (CENACE), a government agency. CENACE was created to run the wholesale spot market, operate the electricity system and dispatch and to provide open access to the electricity system to ensure IPPs wishing to interconnect are dealt with independent of CFE.

Within the context of Mexico's incipient market, rapidly evolving electricity system and CENACE's observed need for continued assessment structures, this research has sought to provide CENACE...

The study is a benchmark study comparing transmission system planning methodologies and cost-benefit analyses, as applied to an interconnected power grid planning process in Mexico, ...

Mexico's 2014 Energy Reform includes incumbent electricity utility unbundling along with the creation of a market-clearing independent system operator (ISO) called CENACE (Centro Nacional de Control de Energía). 1. The Reform is a foundation for wholesale markets in energy, capacity, ancillary services, and financial transmission rights (FTRs).

In the world of power system operation, the reliability and efficiency of energy delivery relies on two key players: Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs). They manage power transmission grids, reliability, and wholesale electricity markets. While RTOs and ISOs have some overlap, they are different ...

The study is a benchmark study comparing transmission system planning methodologies and cost-benefit analyses, as applied to an interconnected power grid planning process in Mexico, US and Europe. The study describes approaches from selected ISOs/TSOs in the US (CAISO, PJM, MISO, ERCOT) and Europe (ENTSO-E) and gives recommendations for ...

Under this new structure, characterized by a nodal pricing system and an independent system operator (ISO), we analyze welfare-optimal network expansion with two modeling strategies. In a first model, we propose the use of an incentive price-cap mechanism to promote the expansion of Mexican networks.
