We present a novel solar PV-geothermal hybrid-led multi-generation energy system analysis for Guatemala, Honduras, and Costa Rica. This study applies a novel multi-variable, multi-sectoral, multi-technology, hourly resolved, and cost optimisation tool.

Semantic Scholar extracted view of " A novel geothermal-PV led energy system analysis on the case of the central American countries Guatemala, Honduras, and Costa Rica" by A. S. Oyewo et al.

This study analyzes the cost-effectiveness and technical performance of a hybrid renewable energy system (HRES) that can meet the power needs of low electricity-consuming households in a rural region of Guatemala.

In this context, we present a novel solar PV-geothermal led energy system analysis for the case of Guatemala, Honduras, and Costa Rica, using the LUT Energy System Transition Model for detailed pathway analyses linked to state-of-the-art resource data.

Steady mass and energy balance analyses via Aspen HYSYS were performed to obtain electric power generation capacity for each standalone geothermal power plant and hybrid power plant.

Josep Monterroso"s project in Guatemala involves an off-grid setup using a POW-LVM5K-48V-N inverter, which converts 48V DC to 120V AC with a 5kW capacity. His system includes three 550W solar panels and a 48V 100Ah lithium battery, making it a robust solution for providing reliable power in remote areas. This setup supports sustainable energy ...
