

What is a photovoltaic energy storage complementary system?

A single-phase, two-stage photovoltaic energy storage complementary system is shown in Figure 1, where the system consists of solar panels, boost converters, bidirectional DC/DC converters, battery packs, inverters, relays, etc. There are two significant features in the system.

What is a photovoltaic energy storage system?

In the household photovoltaic system, energy storage devices are added to improve the scheduling and control of the system energy and optimize the energy utilization rate of the system. The photovoltaic and energy storage systems, with similar topological structures, are commonly called photovoltaic energy storage complementary systems.

Do photovoltaic grid-connected systems have energy storage units?

Due to the characteristics of intermittent photovoltaic power generation and power fluctuations in distributed photovoltaic power generation, photovoltaic grid-connected systems are usually equipped with energy storage units. Most of the structures combined with energy storage are used as the DC side.

Can photovoltaic inverter control reduce the requirements of system coordinated control?

The simulation results verified that the control method proposed in this paper can reduce the requirements of system coordinated control and smooth the output power of the photovoltaic inverter, which has certain engineering application value.

Where are energy storage units located in a photovoltaic power generation system?

The difference in the number of variable current stages of the photovoltaic power generation system causes most of energy storage units to be located on the DC side of the power generation system; these units can be classified into single-stage type and two-stage type based on the power conversion modes.

Can a bidirectional LLC resonant converter be used for photovoltaic energy storage?

Finally, the improved bidirectional LLC resonant converter is applied to the photovoltaic energy storage complementary system. The correctness and feasibility for the bidirectional LLC converter topology under the proposed charging and discharging control strategy of the DC bus are verified by simulation and experimental results.
