

What is a solar generator & how does it work?

Solar generators convert sunlight into energy to power your devices and appliances when you don't have electricity, making them a perfect item to bring with you on a camping trip, or as a home backup system for running small appliances during a power outage.

What is a solar generator?

Solar generators are portable battery storage systems powered by solar panels. Unlike solar-plus-storage systems, solar generators are not designed to back up major appliances in the event of an outage. You can compare solar generators by assessing the watts and watt-hours of the systems, as well as their battery chemistries.

What is solar photovoltaic (PV) power generation?

Solar photovoltaic (PV) power generation is the process of converting energy from the sun into electricity using solar panels. Solar panels, also called PV panels, are combined into arrays in a PV system. PV systems can also be installed in grid-connected or off-grid (stand-alone) configurations.

How powerful is a solar generator?

Solar generators are not as powerful as their gas/diesel powered cousins. There are many gas generators that produce 5,000 watts to 10,000 watts and more of power. In contrast, the most powerful solar generators peak at 2,000-3,000 watts. This limits how much power you can draw at the same time from the power station.

Are solar panels a generator?

Solar panels can't act as generators on their own - the electricity they generate needs to be stored somewhere. So, solar generators typically consist of two main products: solar panels and a battery storage system. When you place your solar panels out in the sun, they generate direct current (DC) electricity.

What is a solar charging generator?

Generators that utilize solar charging are a reliable source of renewable solar energy in a power outage, or when you need electricity outdoors.
