Solar power generation project mode selection

Why is site selection important for solar power plants?

The site selection for solar power plants has a significant impact on the cost of energy production. A favorable situation would result in significant cost savings and increased electricity generation efficiency. California is located in the southwest region of the United States of America and is blessed with an abundance of sunlight.

Can a CBA model be used to design a solar power plant?

Considering the complexity of solar power plant construction, this study proposes a scheme that incorporates the CBA method and a solar power plant model involving economic, technological, geographical, environmental, and social factors to provide technical support for optimal site selection in California.

Is cost an independent factor in solar power plant site selection?

To fill this research gap, this paper considers cost as an independent factor in the process of solar power plant site selection to reflect the value of cost and to maximize investors' return on investment.

How is CBA used for solar power plant site selection?

CBA's tabular approachis utilized for solar power plant site selection. As illustrated in Fig. 3,the tabular CBA method comprises of six steps 58: 1. Determining possible site alternatives. In this study,three possible site alternatives (S1,S2,and S3) are ultimately produced by imposing some constraints on the investigation.

How important are technical and social factors when choosing a solar power plant?

Additionally, the overall score for technical and social variables is high, showing that decision-makers place a premium on the benefits of these two factors when selecting a solar power plant site. The score distribution of each factor's advantage.

Is S2 a good site for solar power plant construction?

Clearly,S2 had the second lowest cost and the highest IofAs value when compared to S1 and S3. S1 and S3 have similar IofAs values; however,S3 is substantially less expensive. In conclusion,S2 is the optimal site for solar power plant constructionusing the CBA method due to its higher cost performance,and the final ranking is S2 > S3 > S1.

o Investigate DC power distribution architectures as an into-the-future method to improve overall reliability (especially with microgrids), power quality, local system cost, and very high ...

(a) Simple schematic diagram for the proposed solar PV-WT dual power generation system, (b) isometric view of the complete system structure, and (c) Multiview drawing with complete ...

Solar photovoltaic (PV) systems are becoming increasingly popular because they offer a sustainable and

SOLAR PRO. Solar power generation project mode selection

cost-effective solution for generating electricity. PV panels are the most critical components of PV ...

The average number of criteria used in site selection processes usually ranges from 6 to 10 (Asakereh et al. 2017). In some non-spatial studies, the number of criteria ...

The efficiency (? PV) of a solar PV system, indicating the ratio of converted solar energy into electrical energy, can be calculated using equation [10]: (4) ? $PV = P \max / P i n c ...$

This paper analyzes the feasibility of the distributed photovoltaic power generation system in this city, based on the actual situation of a photovoltaic power generation project in a certain place. ...

Accordingly, this paper first briefly introduces the solar-wind generation system and next develops its critical success criteria. Then, a fuzzy analytic hierarchy process ...

A real case study Selection of a suitable solar-wind power generation project in China should be implemented by feasibility analysis at the discretion of local circumstances. ..., AHP with ...

request for selection (r fs) of solar power generator (s pg) for design, survey, supply, installation, testing, commissioning and operation & maintenance of grid connected feeder level solar ...

A single source of electric power delivery to the consumer, local load is a diverse generation strategy such as conventional fossil fuel generation like oil, coal, etc. or ...

This guidance covers a large number of topics at a high level. Its goal is to provide an overview of the key elements that should be considered when designing and operating solar PV plants, ...

The average number of criteria used in site selection processes usually ranges from 6 to 10 (Asakereh et al. 2017). In some non-spatial studies, the number of criteria increases to 20 (Solangi et ...
