#### What is the VOC of inverted perovskite solar cells based on PCBM?

Sun,X. H. et al. VOC of inverted perovskite solar cells based on N-doped PCBM exceeds 1.2 V: interface energy alignment and synergistic passivation. Adv. Energy Mater. 13,2302191 (2023). Zhang,C. et al. Crystallization manipulation and holistic defect passivation toward stable and efficient inverted perovskite solar cells. Energy Environ.

#### Do hybrid perovskites require phonons?

The transitions between the valence band and the conduction band do not require phonons, leading to large extinction coefficients and efficient emission. In addition, hybrid perovskites have an adjustable exciton energy, tunable bandgap and bipolar charge carrier mobility.

#### Why is PCBM better than perovskite?

Simultaneously, PCBM exhibits better interface compatibility with the perovskite, which is beneficial for fabricating high-performance devices. The remarkable electron transport capability of PCBM allows for efficient electron extraction from the perovskite layer.

Perovskite tandem solar cells are a type of tandem solar cell, which uses perovskite materials as one, or both, of the active layers. The bandgap of a perovskite can be easily tuned by changing the perovskite composition, meaning that it can be paired with other solar cells, such as silicon, CIGS, or organic photovoltaics, to make hybrid tandem ...

Perovskite solar cells have attracted a lot of attention in recent years due to their potential to achieve high power conversion efficiency, but their commercial viability has been limited by challenges in mass production and ...

Perovskite solar cells are covered in detail in the Ossila guide Perovskite Solar Cells: An Introduction. In short, perovskite materials are based on a generic ABX 3 structure, where A is an organic cation such as methylammonium (CH 3 NH 3 +), B is an inorganic cation, typically lead (Pb 2+) and X is a halogen anion, such as chloride (Cl-) or ...
