What happens if a solar panel is broken?

Common causes of solar panel damage are falling objects, thermal stress, and micro-cracks and scratches. A broken solar panel may continue to work, albeit at a reduced efficiency. Broken solar panels pose a serious fire and safety risk and must be removed and replaced. Some companies can fix broken solar panels, but this is costly.

Why do solar panels not look damaged by impact?

If energy production is down but solar panels don't look damaged by impact, the problem is most likely within the solar cells themselves. Solar panels are made up of tiny cells that are, in turn, composed of tiny "wafers" made of silicon. Each wafer is under 200 microns thick.

Can a crack on a solar panel affect performance?

Spotting a crack on your solar panel might send you into a spiral if you just purchased them. Fortunately, most cracks won't impede your panel's performance. A more severe crack could reduce its overall output. Minor cracks might not make any difference at all. Modern solar panels tend to be built with a protective casing.

What happens if a solar panel is damaged in high winds?

In high winds, debris with sharp corners and edges (like a piece of sheet metal) may be picked up and slammed into the panel's surface. This can cause obvious breakage, such as smashed glass and for the panel to cease operating entirely.
