

Thickness of oxide film on photovoltaic bracket block

How does absorber thickness affect the performance of a perovskite solar cell?

Absorber thickness is one among key parameters that can have significant effects on the performance of the solar cell. An appropriate absorber thickness should be chosen to optimize the performance of the cell. The main objective of this work is to offer a perovskite solar cell with high efficiency using a suitable thickness of the active layer.

Why do we need a thick-film perovskite layer?

The increase in film thickness promotes the formation of uniform films with full coverage in large-scale coatings^{4,14}. Moreover, a thick-film perovskite layer also helps with device reproducibility¹¹, which enhances production reliability, a key factor for the industrial competitiveness.

How does a solar cell absorber thickness affect voltage and FF?

Specifically, it is observed that V_{oc} and FF decrease as the thickness increases, primarily due to the rise in series resistance. In general, an increase in absorber thickness can result in higher values for two key parameters of the solar cell: short-circuit current and open-circuit voltage.

How does the thickness of a perovskite layer affect V_{OC} and FF?

The figure clearly demonstrates that the impact of the perovskite layer on these four parameters varies across the entire thickness range, from 300 nm to 1200 nm. Specifically, it is observed that V_{oc} and FF decrease as the thickness increases, primarily due to the rise in series resistance.

Can metal oxide layers be feasibly deposited on perovskite solar cells?

These layers can be deposited via atomic layer deposition or electron beam and are summarized in Supplementary Table 5. In summary, we have demonstrated a low-cost barrier technology based on ultralightweight metal oxide layers that can be feasibly deposited on perovskite solar cells.

Does a silicon oxide layer Harden perovskite photovoltaics to space stressors?

Although terrestrial conditions require durability against stressors such as moisture and partial shading, space poses different challenges: radiation, atomic oxygen, vacuum and high-temperature operation. Here we demonstrate a silicon oxide layer that hardens perovskite photovoltaics to critical space stressors.
